

- ✓ Various measurement processes
 - ✓ Rapid
 - ✓ Independent of viscosity
 - ✓ Free from losses
- ✓ Plenty of measurement ranges
- ✓ Analogue output signal
- ✓ M12 plug-in connection
- ✓ 24 VDC

The **SensoControl®** flow sensors are used for the exact determination of volume flows in hydraulic equipment (eg test and inspection stands).

The sensors deliver an output signal proportional to the volume flow for further processing in an electronic system and are compatible with the usual proven industrial standards.

- ✓ M12 plug-in connection
- ✓ 24 VDC
- ✓ 0/4...20 mA

The volume flow can be easily displayed in combination with the SCE-020 built-in measuring instrument.

To meet a multitude of application requirements there are three different measurement principles available:

2.1 SCQ Flow meter

- ✓ **Measurement principle: spring/piston**
- ✓ **Response time $\leq 2 \text{ ms}$**
- ✓ **Measurement in both directions**
- ✓ **Wide viscosity range**
- ✓ **Compact construction**
- ✓ **Pressure resistant up to 420 bar**

SCQ measurement principle

Function

The piston (K) is moved by flow from A to B or B to A. In idle mode, the spring (F) and piston (K) are in equilibrium. The change in travel (S) is proportional to the volume flow and is converted into a measured value by the built-in electronics. If the direction of flow changes (B to A), flow directions can be displayed (eg -45.8 l/min). The reaction time of the piston movement is smaller than 0.002 s.

Application

The rapid capture of the flow quantity is of great importance in the field of high-pressure hydraulics.

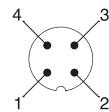

Mounting with the connection block permits a combined measurement of p, T and Q. With the in-line adaptor for tube or hose mounting, rapid installation of the SCQ into the hydraulics is achieved. The rugged construction enables use to continue even under extreme conditions, as for example, high load reversals or pressure increase speeds.

If highly dynamic volume flow changes are to be captured, the SCQ is the ideal solution. Rapid load changes, which can cause damage to valves or pumps, can be safely captured. Because of its unique measuring process, the SCQ is also in a position to capture volume flows in both directions.

2.2 Messturbine SCFT

- ✓ **Measurement principle: turbine**
- ✓ **Response speed ≤ 50 ms**
- ✓ **Measurement ranges from 1 to 800 l/min**
- ✓ **Low flow resistance**
- ✓ **Nominal pressure to 480 bar**
- ✓ **Suitable for reverse operation**
- ✓ **Built-in pressure and temperature connections**

Function

The turbine wheel is driven by the oil flow and starts to turn. The frequencies which this produces are processed by the digital electronics and the influences of interfering flow effects are compensated. Thanks to low flow resistance Q_R , the hydraulic circuit is operated with low losses

Because of the special vane design, reverse operation is also possible, ie. the turbine can be operated in both directions.

The turbine is equipped with an EMA-3 screw coupling for measurement of pressure. Oil temperatures can be measured by inserting an SCT-150 directly into the turbine oil stream. In this way all the important measurement parameters are available at one installation location.

Application

If the volume flow is to be captured without loss over wide volume ranges (up to 800 l/min), then the SCFT is the ideal solution.

2.3 SCVF Volume counter

- ✓ **Measurement principle:**
gearwheel volume counter
- ✓ **8 measurement ranges**
from 0.01...2 to 1.0...300 l/min
- ✓ **Measurement accuracy $\pm 0,5\% \text{ FS}$**
- ✓ **Pressure resistant to 400 bar**
- ✓ **High viscosity range**
- ✓ **Low noise**
- ✓ **Exact flow measurement**
over wide viscosity range
- ✓ **Flexible use for various media**

Gearwheel counter for high accuracy flow measurement in hydraulic equipment

Function

The **SCVF** gearwheel counter works as a volume flow counter. A very precisely machined pair of gears is driven by the fluid flow. The **SCVF** works in a wide range of viscosities. Various seals permit a variety of applications.

Applications

Thanks to this wide range of viscosities, all fluids which can be pumped and have a certain degree of lubricating ability can be measured:

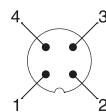

- ✓ Brake fluid (EPDM seals)
- ✓ Skydrol
- ✓ Mineral oils
- ✓ Hydraulic oils
- ✓ Greases

If exact flow measurements over a wide range of viscosities are to be captured, the SCVF is the ideal solution.

6 Determination of Flow Volume

Depending on the measurement job to be done, various measuring instruments are available to the hydraulic technician:

1 Flow meter type SCQ

- Flow measurement with direction indication
- Very fast reaction time < 2 ms
- Wide viscosity range
- Screw-in cartridge in connector block SCAQ

2 Turbine flow meter type SCFT

- Very low flow resistance
- Built-in measurement points for pressure and temperature
- Very simple installation into a hydraulic system
- 6 different measuring ranges up to 750 l/min.
- Recording of a p/Q characteristic curve with a load valve to determine hydraulic performance

3 Gear flow meter type SCVF

- High precision flow measurement over a wide range of viscosity
- 4 measuring ranges up to 300 l/min.
- flexible use with various fluids

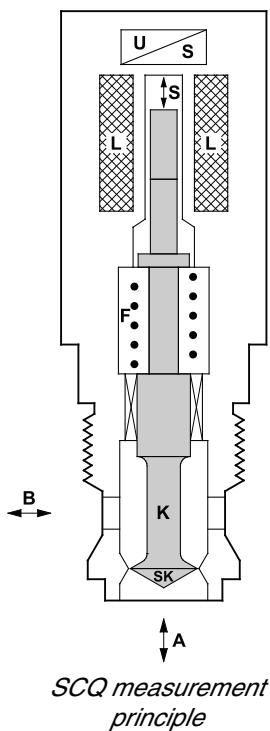

In addition to pressure measurement, the precise determination of flow volume in hydraulic equipment gives important evidence of the condition of the hydraulics. The efficiency of hydraulic drives such as hydrostatic units or variable pumps depends on the amount of flow. Hydraulic performance is determined by pressure and flow. The degree of wear in a hydraulic drive can be ascertained by comparing nominal and actual values. The resulting measurements can be used, for example, in preventive maintenance for systematic servicing and cost reductions. In mobile hydraulics, the efficiency of the machine is continually checked and documented. The diagnosis of pressure and flow thereby gives a total analysis.

- **Measurement principle:**
spring/piston system
- **Flow measurement with direction indication**
- **Response time < 2 ms**
- **Compact design**
- **Withstands pressures up to 420 bar**
- **Wide range of viscosity**
- **p/T/Q measurement possible with connection block**

Flow measurement with direction indication for mobile and stationary measurement jobs

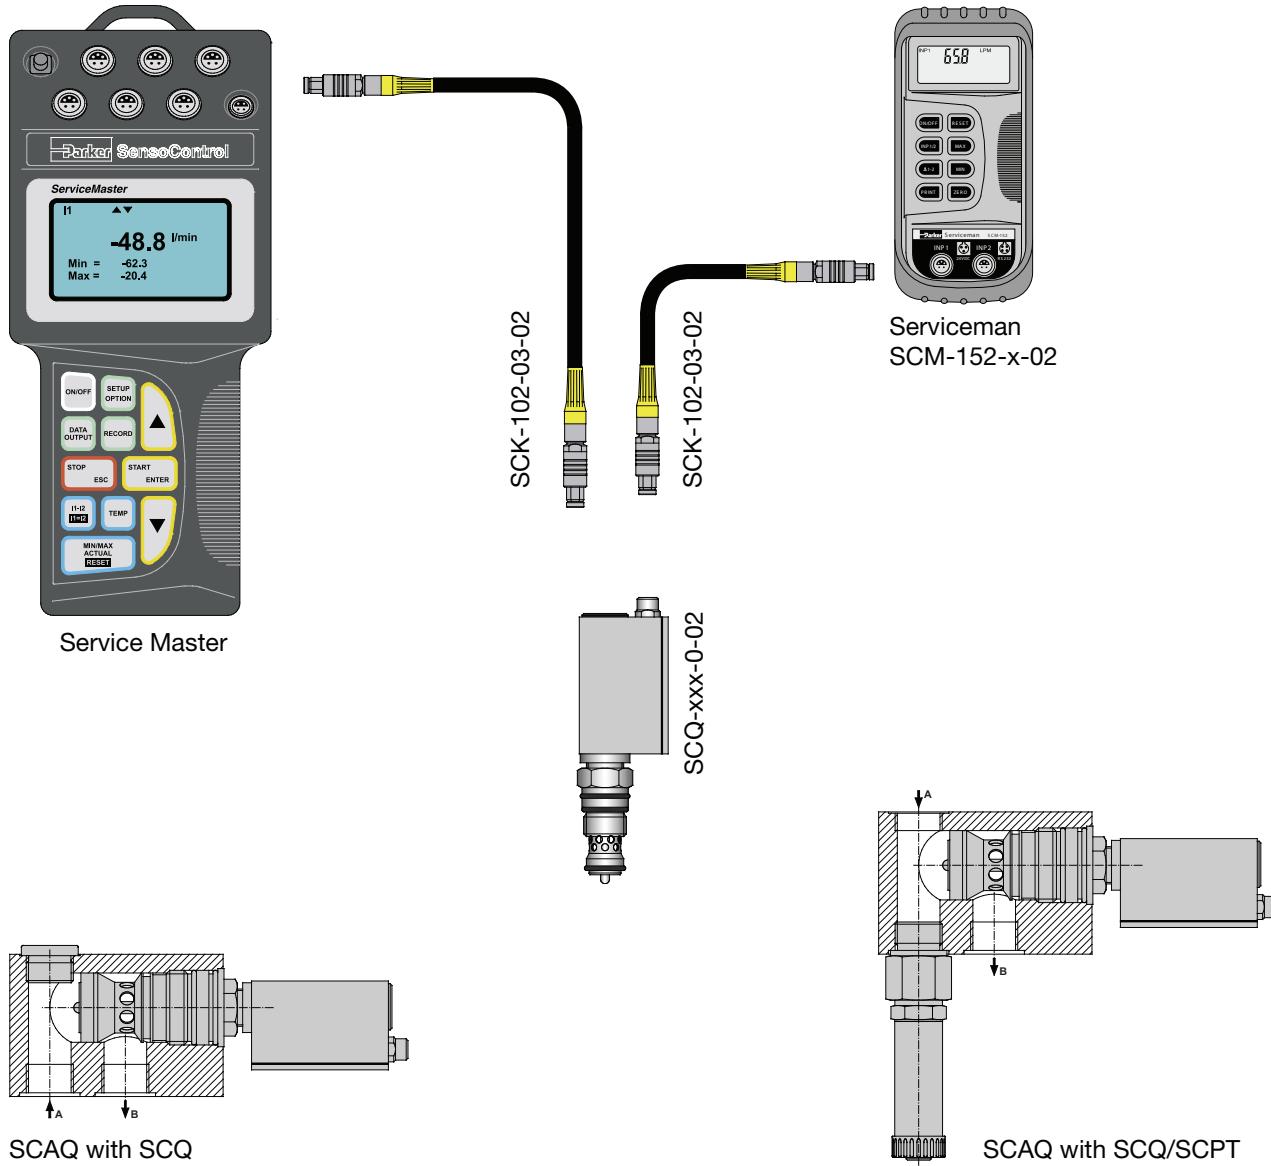

Function

When there is a flow from A to B or B to A, the piston (K) is moved. When at rest, the spring (F) and piston (K) are in equilibrium. The stroke change (S) is proportional to the flow volume and is converted by the built-in electronics to a measured value. By the change in direction of the piston (B to A) flow directions can be shown (e.g. -45.8 l/min.). The response time of the piston movement is less than 0.002 s.

Application

In the field of high pressure hydraulics, the rapid capture of the amount of flow is of great significance. The reaction times of the SCQ's enable the dynamic behaviour of hydraulic systems to be measured. The indication of direction is helpful when searching for faults in hydraulic systems. Rapid load changes, which can cause damage for example in valves and pumps, can be determined. Installation with a connection block permits the combined measurement of p, T and Q. Rapid assembly of the SCQ's is achieved with an in-line adaptor for tube or hose installation.

Robust design makes possible extreme condition applications, such as, for example, high load changes or rates of pressure increase.

- **Low flow resistance**
- **Built-in pressure and temperature measurement points**
- **Suitable for reverse operation**

Flow measurement with low flow resistance combined p/T/Q measurement

Function

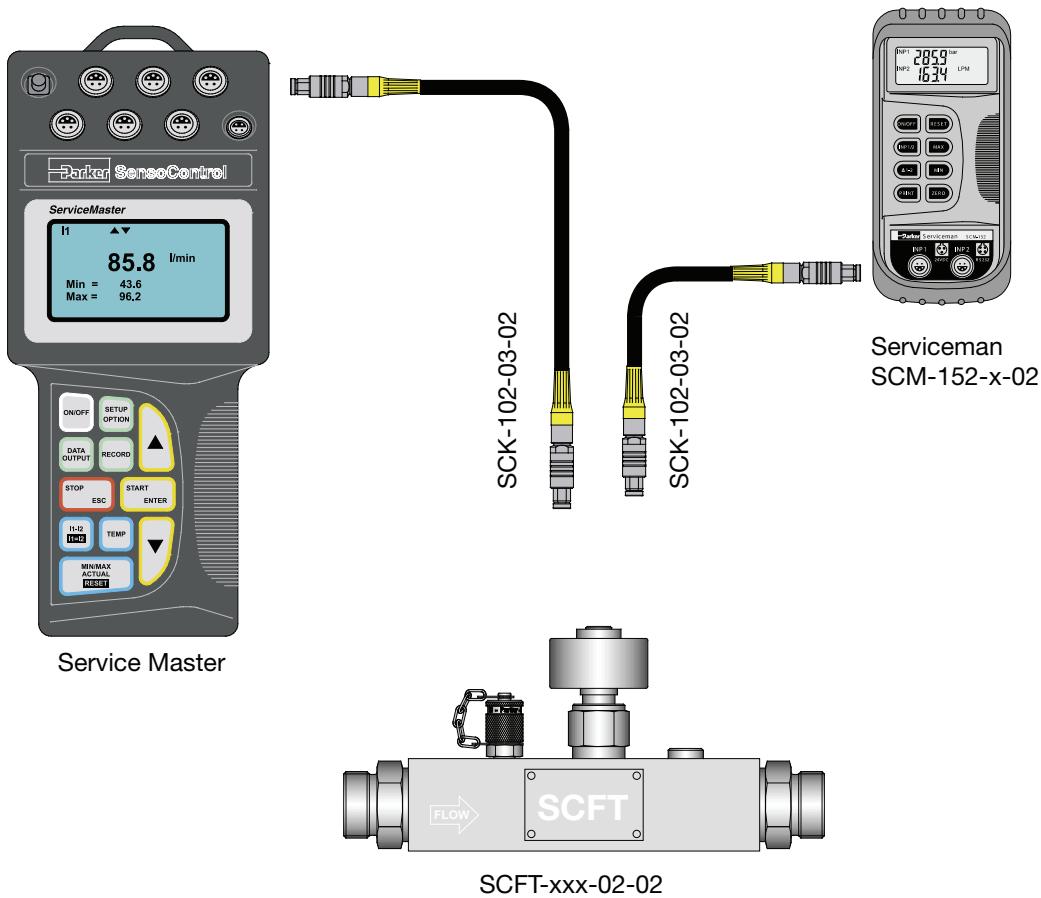

A turbine wheel is driven by the oil flow. The frequencies thus produced are processed by digital electronics. The influence of turbulent flow effects is compensated for.

Because of the low flow resistance Q_R , the hydraulic circuit operates with very low losses. For pressure measurement the turbine is equipped with an EMA-3 test point.

Oil temperatures are measured direct in the oil flow. Consequently all the important measurement parameters are available at one measuring location.

Applications

- mobile diagnosis (SCFT with SCM)
- p-Q measurement in construction and agricultural machines
- hydraulic tests with load valves
- automatic scaling

Measurement of pressure, flow and temperature using Service Master and hydraulic-tester SCLV-PTQ

The p-Q diagram (to the right) shows the power determined. Especially in hydraulic pump (load sensing) systems the speed-dependent load is important to analyze. The evaluation in **SensoWin®** will be done quickly and simply.

The hydraulic power of a system can be analyzed by a combined measurement of pressure and flow (to the left). The diagram shows an application with a hydraulic-tester SCLV-PTQ. Pressure in the system is generated by the integrated loading valve.

In the evaluation power will be calculated from the flow volume and pressure of the pump.

- **Measurement principle:**
volume counter/positive displacement
- **4 flow ranges up to 300 l/min**
- **Measurement accuracy $\pm 0.5\%$ FS**
- **Withstands pressures up to 400 bar**
- **High viscosity range**
- **Low noise emission**

Gear flow for the precision measurement of flow in hydraulic equipment

Function

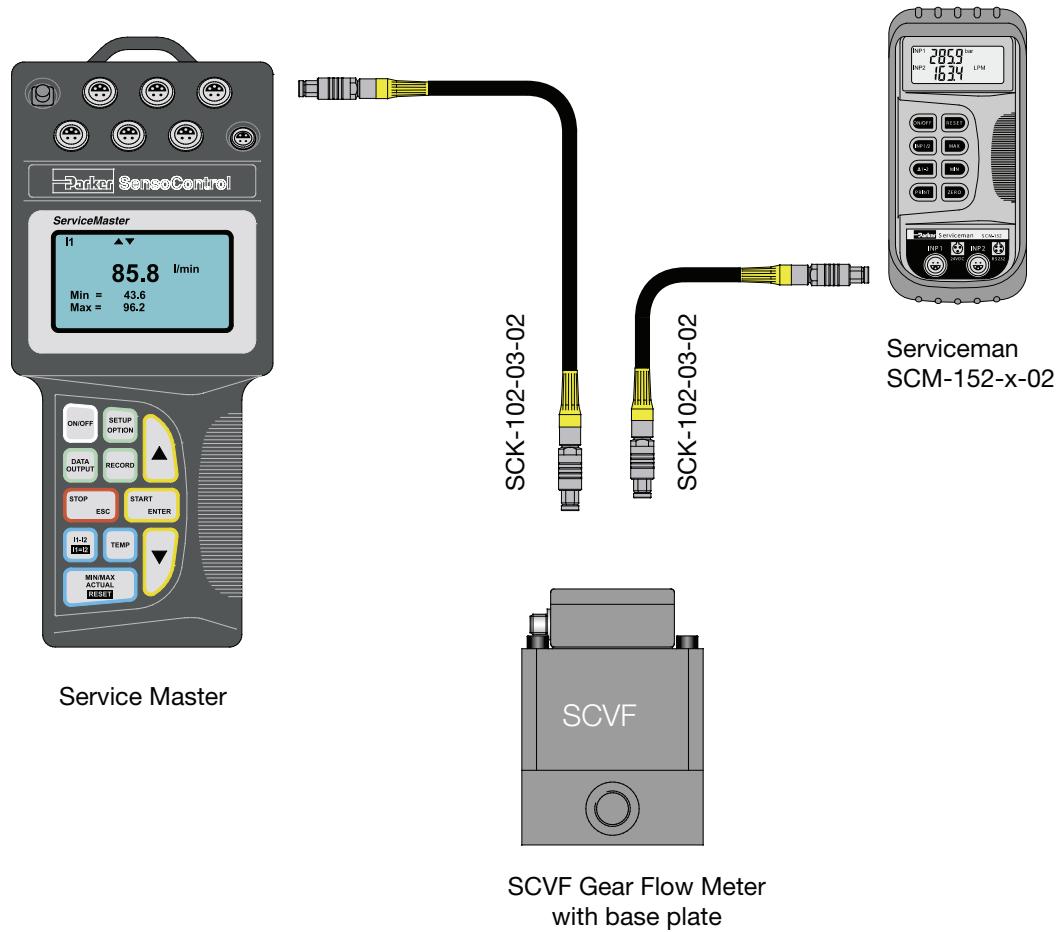

The **SCVF** gear flow meter operates as a flow volume counter. A very precisely machined pair of gears is driven by the fluid flow.

The **SCVF** accommodates a wide range of viscosity. Various seals* permit a large number of applications.

Applications

Because of the wide viscosity range, all fluids which can be pumped and have a certain lubricating capability can be measured.

- brake fluids (EPDM Sealing)
 - Skydrol
 - mineral oils
 - hydraulic oils
 - fats
-
- mobile diagnosis (SCVF with SCM)
exact Q measurement (oil leakage)
automatic scaling (sensor recognition)
